SOFTWARE ENGINEER

Software engineering student with a solid background in backend development, data modeling, and process optimization. Focused on transforming complex problems into efficient software solutions through clean architecture and solid design principles.

EXPERIENCES

Cafeteria Management System

- Developed a canteen management system in Java, applying Spring Boot-inspired architecture, Domain-Driven Design (DDD), JPA, and an InMemory Repository.
- Implemented data persistence, dependency injection, and automated testing, ensuring modularity and maintainability.
- Result: A fully functional system that enables user authentication and management, as well as the administration of products, menus, orders, and billing.

ClinicPro

- Built a clinic management system in C# using .NET, Entity Framework, and Domain-Driven Design (DDD), supported by C4 diagrams across all architectural levels.
- Designed and implemented RESTful HTTP endpoints to support full CRUD operations for patients, doctors, appointments, and specialties.
- Developed appointment scheduling logic with conflict detection and medical record management.
- Result: A scalable and maintainable system with a fully documented API supporting structured clinical workflows.

Order and Production Management System

- Created an industrial order and production management system in Java using an MVC architecture, without relying on frameworks.
- Modeled and implemented complex entities and relationships using pure SQL, integrating clients, orders, products, and suppliers.
- Developed a production simulator capable of calculating operation times, efficiency, and workstation utilization.
- Result: A robust application for production planning and process optimization.

SKILLS

- **Backend:** Spring Boot, .NET
- **Databases:** PostgreSQL, Oracle, H2
- **Languages:** Java, C#, SQL
- **Other Tools & Concepts:** GitHub Actions, Scrum / Agile

EDUCATION

Software Enginner - ISEP (Instituto Superior de Engenharia do Porto)
2023 - 2026
